

USCD Machine Learning Bootcamp Capstone Deployment Checklist

1. Delete amplify_outputs.json from local repo workspace, if applicable.
2. Deploy GitHub repo "AI-Swedish-Whisperer-NG" to AWS Amplify. Just use Amplify's default settings in the deployment wizard.
3. Go to the "Deployed Backend Resources" section of the deployed repo. Download the new amplify_outputs.json and copy/paste it to the local repo workspace.
4. Search the following Lambda functions under "Deployed backend resources":
gemmaMiniSwedishlambda[id_#], gemmaSwedishlambda[id_#], ministralSwedish[id_#],
tutorSwedishlambda[id_#]. For each lambda function, click it and go to "Configuration".
Increase the default timeout from 3 seconds to at least 10 minutes or more. These allow
each of the LLMs in Bedrock more than 3 seconds to respond to each prompt.
